SWR mode  
Display all parameters  

## Applications  
Antennas  
Coaxial lines  
Measurement of other elements  

## Annexes  
Annex 1: Specifications  
Annex 2: Precautions  
Annex 3: Setup menu
Thank you for purchasing a **RigExpert AA-35 ZOOM** Antenna and Cable Analyzer! We did our best to make it powerful yet easy to use.

The analyzer is designed for measuring SWR (standing wave ratio), return loss, as well as other parameters of cable and antenna systems in the range of 60 kHz to 35 MHz. A built-in ZOOM capability makes graphical measurements especially effective.

The following tasks are easily accomplished by using this analyzer:

- Rapid check-out of an antenna
- Tuning an antenna to resonance
- Comparing characteristics of an antenna before and after specific event (rain, hurricane, etc.)
- Making coaxial stubs or measuring their parameters
- Measuring capacitance or inductance of reactive loads
First time use

Please insert two AA batteries (only alkaline or Ni-MH ones) into the battery compartment of the analyzer, watching the polarity. Instead, you may power it from a spare USB port of your computer by using a conventional USB cable.

Press the (Power) key located at the bottom-right corner of the keypad to turn on the analyzer. After displaying the initial message (showing a firmware version and a serial number of the instrument), a Main menu appears on the screen.

Do not use Li-ion or other batteries with voltage more than 1.5 V.

The analyzer will be turned off automatically if not in use for too long.

Main menu

The Main menu acts as a starting point from where different tasks may be launched.

Use ⟨Cursor up⟩ (Cursor up) and ⟨Cursor down⟩ (Cursor down) keys to scroll through the menu, then press ⟨OK⟩ (OK) to select an item. For your convenience, a battery indicator is shown at the top-left corner of the screen. This indicator is replaced with a USB icon when the analyzer is connected to your computer.

You may use hot keys for the quick access to certain tasks. For instance, press the 4 (SWR chart) button to open the SWR chart screen immediately.
Multifunctional keys

Most keys on the analyzer’s keypad perform several functions.

For instance, numbers (1) are used to enter frequency and other numerical parameters. Main functions (2) provide quick access to most common tasks. Alternative functions (3) are executed if the user holds the (Functional) key. For the convenience, alternative functions are marked with yellow.

You may press the (Help) key to open a help screen listing all active hot keys.

Connecting to your antenna

Plug the cable to your analyzer’s antenna connector, and then tighten the rotating sleeve. The rest of the connector, as well as the cable, should remain stationary.

If you twist other parts of the connector when tightening or loosening, damage may easily occur. Twisting is not allowed by design of the UHF-connector.
**SWR chart**

Once your antenna is connected to the analyzer, it is time to measure its characteristics. Press the 4 (SWR chart) key to open the SWR chart screen, then press \(\checkmark\) (OK) to start a new measurement.

A few moments later, the result will be displayed on the analyzer’s screen.

Press the \(\text{F} + \checkmark\) key combination to run a continuous sweep.

*A small triangle at the bottom of the chart corresponds to a point at which the SWR reaches its minimum.*

---

**Chart ZOOM**

Use the arrow keys to increase or decrease the center frequency or the scanning range. Watch the chart zooming in or out, or changing its position. Use the \(\text{F}\) (Functional key) and ▲ (Cursor up) or ▼ (Cursor down) key combination to zoom the vertical scale of the chart.

*Do not forget to press the \(\checkmark\) (OK) key for the new measurement to start.*

Press \(\text{F}\) (Functional key) and 0 to quickly choose a radio amateur band.

---
Data screen

The data screen is available in all chart modes. Press the **0** (Data) key to display various parameters of a load at cursor.

Frequency and range entry

To enter the center frequency or the sweep range, press the **3** (Frequency, Range) key.

Use cursor keys to navigate, or the **0** to **9** keys to enter values. Do not forget to press the **✓** (OK) key to apply.

Press ▲ (Up) or ▼ (Down) cursor keys while holding the **F** (Functional) key to quickly choose a radio amateur band.
Press the **5** (R,X chart) key in the **Main menu** to access the **R,X chart** mode.

Positive values of reactance (X) correspond to inductive load, while negative values correspond to capacitive load.

The chart will display R and X for series or parallel models of a load. Press **F** (Functional key) and **1** to switch between these models.

*The marker at the bottom of the screen shows a resonant frequency closest to the center of the scan.*
Memory operation

Press the 6 (Save) key to save the chart into one of 10 available memory slots.

To retrieve your readings from the memory, press then 9 (Load) key, select a memory slot number and press ✓ (OK).

To rename any existing memory slot, press F (Functional key) and 9 (Edit) key combination.

SWR mode

To watch the SWR at a single frequency, press the 7 (SWR) key.

Do not forget to press the ✓ (OK) key to start or stop the measurement. Change the frequency with ◁ (Left) or ▶ (Right) cursor keys, or press the 3 (Frequency) key to enter a new frequency.

The SWR icon in the top-left corner flashes when the measurement is performed.
### Display all parameters

To display various parameters of a load on a single screen, press the (All) key.

<table>
<thead>
<tr>
<th>17 500 kHz</th>
</tr>
</thead>
<tbody>
<tr>
<td>SWR 1.82</td>
</tr>
<tr>
<td></td>
</tr>
</tbody>
</table>

**Series model**

| R 45.0 Ω | L 259.1 nH |
| X 28.5 Ω | C -319.2 pF |

-  - start/stop, - help.

*Do not be confused by negative values of L or C. This can be useful for experienced users.*

This screen displays values for **series** as well as **parallel** models of impedance of a load.

- In the **series** model, impedance is expressed as resistance and reactance connected in series:

  \[ Z = R + jX \]

- In the **parallel** model, impedance is expressed as resistance and reactance connected in parallel:

  \[ Z = R \| jX \]
Antennas

Checking the antenna

It is a good idea to check an antenna before connecting it to the receiving or transmitting equipment. The SWR chart mode is good for this purpose.

The picture on the left shows the SWR chart of a HF antenna. The operating frequency is 14.3 MHz. The SWR at this frequency is about 1.3, which is acceptable.

The next screen shot shows SWR chart of another antenna. The actual resonant frequency is about 14.65 MHz, which is too far from the desired one. The SWR at 14.3 MHz is 2.8, which is not acceptable in most cases.
Adjusting the antenna

When the measurement diagnoses that the antenna is off the desired frequency, the analyzer can help in adjusting it. Physical dimensions of a simple antenna (such as a dipole) can be adjusted knowing the actual resonant frequency and the desired one. Other types of antennas may contain more than one element to adjust (including coils, filters, etc.), so this method will not work. Instead, you may use the SWR mode or the All parameters mode to continuously see the results while adjusting various parameters of the antenna.

Coaxial lines

Open- and short-circuited cables

The pictures on the right show R and X charts for a piece of cable with open- and short-circuited far end. A resonant frequency is a point at which X (reactance) equals to zero:

- In the open-circuited case, resonant frequencies correspond to (left to right) 1/4, 3/4, 5/4, etc. of the wavelength in this cable;
- For the short-circuited cable, these points are located at 1/2, 1, 3/2, etc. of the wavelength.
Cable length measurement

Resonant frequencies of a cable depend on its length as well as on the velocity factor.

A velocity factor is a parameter which characterizes the slowdown of the speed of the wave in the cable compared to vacuum. The speed of wave (or light) in vacuum is known as the electromagnetic constant: \( c = 299,792,458 \) meters (or 983,571,056 feet) per second.

Each type of cable has different velocity factor: for instance, for RG-58 it is 0.66. Notice that this parameter may vary depending on the manufacturing process and materials the cable is made of.

To measure the physical length of a cable,

1. Locate a resonant frequency by using the R,X chart.

   **Example:**

   The 1/4-wave resonant frequency of a piece of open-circuited RG-58 cable is 4100 kHz.

   

   \[
   299,792,458 \times 0.66 = 197,863,022 \text{ meters per second} \\
   \text{- or -} \\
   983,571,056 \times 0.66 = 649,156,897 \text{ feet per second}
   \]

2. Knowing the electromagnetic constant and the velocity factor of the particular type of cable, find the speed of electromagnetic wave in this cable.
3. Calculate the physical length of the cable by dividing the above speed by the resonant frequency (in Hz) and multiplying the result by the number which corresponds to the location of this resonant frequency (1/4, 1/2, 3/4, 1, 5/4, etc.)

```
197,863,022 / 4,100,000 × (1/4) = 12.06 meters
- or -
649,156,897 / 4,100,000 × (1/4) = 39.58 feet
```

**Velocity factor measurement**

For a known resonant frequency and physical length of a cable, the actual value of the velocity factor can be easily measured:

1. Locate a resonant frequency as described above.

```
Example:
5 meters (16.4 feet) of open-circuited cable. Resonant frequency is 9400 kHz at the 1/4-wave point.
```

2. Calculate the speed of electromagnetic wave in this cable. Divide the length by 1/4, 1/2, 3/4, etc. (depending on the location of the resonant frequency), then multiply by the resonant frequency (in Hz).

```
5 / (1/4) × 9,400,000 = 188,000,000 meters per second
- or -
16.4 / (1/4) × 9,400,000 = 616,640,000 feet per second
```

3. Finally, find the velocity factor. Just divide the above speed by the electromagnetic constant.

```
188,000,000 / 299,792,458 = 0.63
- or -
616,640,000 / 983,571,056 = 0.63
```
Cable fault location

To locate the position of a probable fault in a cable, just use the same method as when measuring its length. Watch the behavior of the reactive component \(X\) near the zero frequency:

- If the value of \(X\) is moving from \(-\infty\) to 0, the cable is open-circuited:

- If the value of \(X\) is moving from 0 to \(+\infty\), the cable is short-circuited:
Making 1/4-\(\lambda\), 1/2-\(\lambda\) and other coaxial stubs

Pieces of cable of certain electrical length are often used as components of baluns (balancing units), transmission line transformers or delay lines. To make a stub of the predetermined electrical length,

1. Calculate the physical length. Divide the electromagnetic constant by the required frequency (in Hz). Multiply the result by the velocity factor of the cable, then multiply by the desired ratio (in respect to \(\lambda\)).

\[
\frac{299,792,458}{28,200,000} \times 0.66 \times (1/4) = 1.75 \text{ meters}
\]

- or -

\[
\frac{983,571,056}{28,200,000} \times 0.66 \times (1/4) = 5.75 \text{ feet}
\]

Example:

1/4-\(\lambda\) stub for 28.2 MHz, cable is RG-58 (velocity factor is 0.66)

A piece of 1.85 m (6.07 ft) was cut. The margin is 10 cm (0.33 ft). The cable is open-circuited at the far end.

2. Cut a piece of cable slightly longer than this value. Connect it to the analyzer. The cable must be open-circuited at the far end for 1/4-\(\lambda\), 3/4-\(\lambda\), etc. stubs, and short-circuited for 1/2-\(\lambda\), \(\lambda\), 3/2-\(\lambda\), etc. ones.

3. Switch the analyzer to the All parameters measurement mode. Set the frequency the stub is designed for.

28,200 kHz was set.

4. Cut little pieces (1/10 to 1/5 of the margin) from the far end of the cable until the X value falls to zero (or changes its sign). Do not forget to restore the open-circuit, if needed.

11 cm (0.36 ft) were cut off.
Measuring the characteristic impedance

The **characteristic impedance** is one of the main parameters of any coaxial cable. Usually, its value is printed on the cable by the manufacturer. However, in certain cases the exact value of the characteristic impedance is unknown or is in question.

To measure the characteristic impedance of a cable,

1. Connect a non-inductive resistor to the far end of the cable. The exact value of this resistor is not important. However, it is recommended to use 50 to 100 Ohm resistors.

2. Enter the **R,X chart** mode and make measurement in a reasonably large frequency range (for instance, 0 to 35 MHz).
3. Changing the display range and performing additional scans, find a frequency where R (resistance) reaches its maximum, and another frequency with minimum. At these points, X (reactance) will cross the zero line.

Example 1:
11.54 MHz – min., 22.8 MHz – max.
Example 2:
60 kHz – max., 28.7MHz – min.

4. Switch to the Data at cursor screen by pressing the (Data) key and find values of R at previously found frequencies.

Example 1:
27.2 Ohm – min., 94.3 Ohm – max.
Example 2:
105.0 Ohm – max, 37.9 Ohm – min.

5. Calculate the square root of the product of these two values.

Example 1:
\[ \text{square root of (27.2 \times 94.3)} = 50.7 \text{ Ohm} \]
Example 2:
\[ \text{square root of (105.0 \times 37.9)} = 63.1 \text{ Ohm} \]
Measurement of other elements

Although RigExpert AA-35 ZOOM is designed for use with antennas and antenna-feeder paths, it may be successfully used to measure parameters of other RF elements.

Capacitors and inductors

The analyzer can measure capacitance from a few pF to about 0.1 μF as well as inductance from a few nH to about 100 μH. Since measuring of capacitance and inductance is not a main purpose of RigExpert analyzers, the user will have to gain some experience in such measurements.

Be sure to place the capacitor or the inductor as close as possible to the RF connector of the analyzer.

1. Enter the **R,X chart** mode and select a reasonably large scanning range. Perform a scan.

![Example 1: Unknown capacitor](image)

![Example 2: Unknown inductor](image)
2. By using left and right arrow keys, scroll to the frequency where X is -25...-100 Ohm for capacitors or 25...100 Ohm for inductors. Change the scanning range and perform additional scans, if needed.

3. Switch to the **Data at cursor** screen by pressing the 0 key and read the value of capacitance or inductance.

**Example 1:**
**Unknown capacitor**

**Example 2:**
**Unknown inductor**

---

**Transformers**

RigExpert analyzers can also be used for checking RF transformers. Connect a 50 Ohm resistor to the secondary coil (for 1:1 transformers) and use **SWR chart** or **R,X chart** modes to check the frequency response of the transformer. Similarly, use resistors with other values for non-1:1 transformers.
Traps

A *trap* is usually a resonant L-C network used in multi-band antennas. By using a simple one-turn wire coil, a resonant frequency of a trap may be measured.

Example:

A coaxial trap constructed of 5 turns of TV cable (coil diameter is 6 cm) was measured.

A one-turn coil (about 10 cm in diameter) connected to the analyzer was placed, co-axially, a few centimeters away from the measured trap. The SWR chart shows a visible dip at 17.46 MHz, which is a resonant frequency of the trap.
**Frequency range:** 0.06 to 35 MHz

**Frequency entry:** 1 kHz resolution

**Measurement for** 25, 50, 75 and 100-Ohm systems

**SWR measurement range:**
- 1 to 100 in numerical modes
- 1 to 10 in chart modes

**SWR display:** numerical or analog indicator

**R and X range:**
- 0…10000, -10000…10000 Ohm in numerical modes
- 0…1000, -1000…1000 Ohm in chart modes

**Display modes:**
- SWR, return loss, R, X, Z, L, C at single frequency
- SWR chart, 100 points
- R, X chart, 100 points

**RF output:**
- Connector type: UHF (SO-239)
- Output signal shape: square, 0.06 to 35 MHz
- Output power: +13 dBm (at 50 Ohm load)

**Power:**
- Two 1.5V alkaline batteries, type AA
- Two 1.2V Ni-MH batteries, type AA
- Max. 4 hours of continuous measurement, max. 2 days in standby mode when fully charged batteries are used
- When the analyzer is connected to a PC or a DC adapter with USB socket, it takes power from these sources

**Interface:**
- 320×240 color TFT display
- 6x3 keys on the water-proof keypad
- Multilingual menus and help screens
- USB connection to a personal computer

**Dimensions:** 103 × 207 × 37 mm
(4.1 × 8.1 × 1.4 in)

**Operating temperature:** 0…40 °C
(32…104 °F)

**Weight:** 310 g (10.9 oz) w/o batteries

**Warranty:** 2 years

*RigExpert AA-35 ZOOM is made in Ukraine.*
Never connect the analyzer to your antenna in thunderstorms. Lightning strikes as well as static discharge may kill the operator.

Never leave the analyzer connected to your antenna after you finished operating it. Occasional lightning strikes or nearby transmitters may permanently damage it.

Never inject RF signal or DC voltage into the antenna connector of the analyzer. Do not connect it to your antenna if you have active transmitters nearby.

Avoid static discharge while connecting a cable to the analyzer. It is recommended to ground the cable before connecting it.

Do not leave the analyzer in active measurement mode when you are not actually using it. This may cause interference to nearby receivers.

If using a personal computer, first connect the cable to the antenna connector of the analyzer, then plug the analyzer to the computer USB port. This will protect the analyzer from static discharges.
Self tests

There are several built-in self tests in the AA-35 ZOOM analyzer, which can be run by the user to make sure the analyzer is working properly.

Make sure all cables or adapters are disconnected from the antenna connector of your analyzer, then press (OK) to start the first test (Detector test).

You should see the “Passed” message in case of success.

Continue with two more tests: the second (Built-in filter test) and the third (Test with load). For the third test, make sure to connect a good 50 Ohm load directly to the analyzer’s antenna connector.
Annex 3
Setup menu

For the quick access to the Setup menu, press the \[ F \] + \[ 1 \] key combination.

There are several settings in the Setup menu:

- **Language** – select a language for the analyzer’s menus
- **Palette** – choose a color scheme
- **Battery** – select a power consumption scheme
- **Sound** – select sound volume
- **Sys. imp.** – select system impedance (25, 50, 75 or 100 Ohm) which affects SWR and return loss readings.
- **Units** – select metric (meters) or imperial (feet) units
- **Bands** – select region for highlighting of radio amateur bands
- **Cable vel. factor** – choose a velocity factor of the coaxial cable for the TDR mode
- **Freq. corr.** – frequency correction of the analyzer’s oscillator
- **Reset settings** – reset the analyzer to factory defaults
- **Clear saved charts** – clear all memory slots
EC DECLARATION OF CONFORMITY
